Approved by the World Agricultural Outlook Board. Summary released November 28, 1988. The next summary of the Cotton and Wool Situation and Outlook report is scheduled for February 27, 1989. Summaries of the Situation and Outlook reports, including tables, may be accessed clectronically. For details, call (202) 447-5505.

The Cotton and Wool Situation and Outlook is published three times a year and is supplemented by a yearbook. Sub-
scriptions are available from the Economic Research Service by calling (301) 953-2515 or writing USDA/ERS, Box 1608 , Rockville, MD 20850. Rates: 1 year \$10, 2 years \$19, 3 years $\$ 27$. Foreign customers add 25 percent for subscriptions nailed outside the United States. Make check payable to USDA/ERS.

Subscriptions also are available from the U.S. Government Printing Office.

## SUMMARY

Based on November 1 conditions, 1988 U.S. cotton production is forecast at 14.8 million bales. Upland production is estimated at 14.5 million bales, and extra-long staple at a record 367,200 bales. Larger acreage is offsetting lower yields, leaving the total crop virtually unchanged from last year. Total area for harvest is estimated at 11.6 million acres, up 16 percent from 1987, reflecting the smaller 1988 acreage reduction program. Yields are expected to average 612 pounds per harvested acre, a 94 -pound drop from 1987's record 706 pounds.
U.S. mills consumed 7.6 million bales of cotton in $1987 / 88$, the most since $1972 / 73$. This season, larger textile inventories, weakened demand for denim, and a trend toward finer count yarns could contribute to a decline in mill consumption to 6.9 million bales. Early-season mill use for August, September, and October averaged near 7.1 million bales on a seasonally-adjusted annual rate.
U.S. cotton export sales at the start of the 1988/89 season totaled only 2.4 million bales, 1.4 million below last season and the lowest in 3 years. Outstanding sales and shipments through mid-November totaled 3.5 million bales, compared to 5.2 million last season. Fierce overseas price competition has been largely responsible. Exports during 1988/89 are expected to fall 24 percent below last season to 5 million bales.

Although the Secretary of Agriculture made several changes in the cotton program last August to make U.S. cotton more competitive, U.S. prices remain above competitors'. U.S. prices for 1988 -crop cotton on the Northern European market climbed 5-7 cents per pound above foreign prices last summer. In October, Memphis Territory-A type cotton averaged 62 cents per pound c.i.f. Northern Europe, while quotations from Pakistan, which are generally the lowest in the index, were 57 cents.

World and U.S. cotton prices generally moved lower last season, reflecting larger U.S. and foreign production, stable world consumption, and adequate carryover supplies. The adjusted world price (U.S. equivalent of world prices) dropped below the loan rate during July and remained below it for the first 4 months of the 1988/89 marketing year. The adjusted world price (AWP) continued to fall through the end of August. Since then, it has increased to nearly 45 cents per pound, up 3 cents from the early-season low. The U.S. average spot price and December futures have followed a similar pattern.
U.S. cotton stocks were expected to decline last year. However, record yields and lower-than-expected cotton use resulted in stocks increasing over 700,000 bales to 5.8 million. Reduced export demand and lower domestic mill use likely will result in carryover stocks near 8.8 million bales this season, over twice the level specified in the Food Security Act of 1985. Reduced export demand and lower
cotton prices this season have resulted isn substantial CCC loan entries. On October 31, almost 1.6 million bales of 1988-crop cotton had been placed under loan.

World cotton production in 1988/89 is expected to rise to 84 million bales, 4 percent above $1987 / 88$ and the second largest on record. Foreign production is projected up more than 3 million bales and may total 69 million. Increased area accounts for the increase.

World cotton consumption is forecast at nearly 83 million bales, about the same as last season. However, foreign consumption is projected up over 200,000 bales. Higher consumption outside the major importers accounts for all the increase. World trade, at almost 24 million bales, is expected to about match last season's level. Competitively priced foreign exports are expected to rise 1.5 million bales to 18.7 million, representing a 79 -percent share of global cotton trade and a 7-percent increase over last season.

In 1989/90, foreign production is likely to rise again because of major producing countries' need to expand tight 1988/89 supplies. Rapidly rising manmade fiber prices, however, should encourage greater world cotton consumption next year. As consumption among cotton importers grows, world trade should expand. As exports increase, the United States may be able to export more because of continued tight supplies among some foreign competitors.

The Secretary of Agriculture has announced major provisions of the 1989 upland cotton program. The new program will not be significantly different from the current one. However, producers will be required to reduce their cotton acreage by 25 percent of their base ( 12.5 percent was required in 1988) to be eligible for target price protection and the CCC loan program.

Specifics for the 1989-crop program include a target price of 73.4 cents per pound, with a loan level of 50.0 cents for base quality upland cotton - Strict Low Middling (SLM) 1$1 / 16$ inch, micronaire 3.5 to 4.9 , at average U.S. location. In addition, if the adjusted world price (AWP) for cotton falls below the announced loan rate, the Plan B marketing loan program will be put into effect. Under Plan B, 1989-crop cotton pledged as collateral for a price support loan may be repaid at the lower of the AWP or the loan level.
U.S. wool consumption in the third quarter of 1988 was 34.5 million pounds, clean. The woolen system consumed 12 million pounds, the smallest quarterly use in over 5 years. Rising wool prices caused larger-than-usual fabric orders to be placed in late 1987 and early 1988. Third-quarter reorders were smaller than usual. The worsted system used 18 million pounds, and contained its largest share of the lower priced coarser-than-60's grades in almost 4 years. Carpet mills took 4.5 million pounds.

## TEXTILES AND THE ECONOMY

Real gross national product (GNP) increased 2.6 percent ( $\$ 25.7$ billion) in third-quarter 1988, following a 3-percent ( $\$ 29.1$ billion) increase in the second quarter and a 3.4 -percent ( $\$ 33.1$ billion) increase in the first quarter. This slower increase is viewed by some as more sustainable over the longer term. The slowdown in GNP was largely accounted for by less growth in business purchases of equipment and exports-two areas of very rapid growth in the first half of the year.

In third-quarter 1988, real personal consumption expenditures increased $\$ 22.3$ billion, after increasing $\$ 19.2$ billion in the second quarter. Expenditures on nondurable goods increased $\$ 8.1$ billion, compared with $\$ 0.9$ billion in the second quarter. Durables expenditures increased $\$ 0.4$ billion, compared with $\$ 9.5$ billion in the second quarter. The large third-quarter increase in nondurables expenditures broke a lengthy quarterly pattern of low or negative growth.

Capacity utilization in October for durable and nondurable manufacturing was 83 and 86.2 percent, respectively. Capacity utilization for durables has risen steadily in 1988, while the rate for nondurables, though higher, has remained quite stable. The rate of capacity utilization for the textile mill products industry has also been stable over the last several months, at about $89-90$ percent.
U.S. industrial production rose .4 percent in October, .2 percent in September, and .3 percent in August, to 139.2 percent of the 1977 annual average. This was 5.1 percent above last October.

Output of clothing decreased .5 percent in August and rose .3 percent in September, the latest month for which data are available. In September the clothing index, at 101.5 percent of the 1977 annual average, was 1.3 percent above September a year earlier. Output of textile materials, at 110.8 percent of the 1977 annual average in September, increased 3.1 percent since June but was still 4.5 percent below the September 1987 level. Thus, when compared to the general production index, output of clothing and textile materials has been depressed.

The U.S. merchandise trade deficit was $\$ 10.5$ billion in September, $\$ 1.8$ billion less than in August. In September, imports ( $\$ 38.6$ billion) were $\$ 1.1$ billion less than in August, and exports ( $\$ 28.2$ billion) were $\$ .7$ billion more. In August, both values were recent-record levels.

While exports have been steadily improving, the value of imports has remained large, resulting in very slow nominal trade balance improvement. Some recent trends indicate that further improvement may be slower still. After falling steadily since early 1985, the trade-weighted value of the dollar rose 4.2 percent in the third quarter of 1988. Additionally,
the import price index for all commodities decreased 1.1 percent in the third quarter-its first quarterly decline in 2 years. The drop was pervasive, affecting seven of the eight major import groups.

The U.S. import price index for textile fibers, which increased at a 10.8 -percent rate from September 1987 to September of this year, declined 2.5 percent in the third quarter. Import prices for clothing, however, increased by 1.7 percent in the third quarter. Thus, conditions for improvement in the apparel trade balance still appear favorable.

Comparison of the volume (square yards equivalent basis) of cotton, wool, and manmade fiber yarn, fabric, and apparel imports for January-September 1987 with the same period in 1988 reveals that total trade is 7.1 percent less in 1988. Yam, fabric, and apparel volume is off $12.0,15.8$, and 4.2 percent, respectively. In terms of specific fibers, this slowdown represents declines in cotton, wool, and manmade fiber imports of $9.7,9.6$, and 4.9 percent, respectively. While volume has declined, the dollar value of imports is essentially unchanged from the previous year because of higher import prices.

In October the Producer Price Index (PPI) for finished goods was unchanged after having risen .4 and .6 percent in September and August, respectively. The PPI for textile mill products fell . 1 percent in October, while the index for apparel was unchanged. The Consumer Price Index for all urban consumers (CPI-U) rose .4 percent in October, about the same as the monthly average rate for the past 9 months. After falling in June, July, and August, the CPI-U for apparel and upkeep rose 2 percent in September and 1.8 percent in October. For the 3 months ending in October, the apparel and upkeep index increased at a 9-percent compound annual rate.

The U.S. unemployment rate for all wage and salary workers was a seasonally adjusted 5.0 percent in October, matching its lowest level since mid-1974. Among apparel workers, unemployment rose during the last 3 months from midyear. Unemployment was $11.7,10.2$, and 7.5 percent in August, September, and October, respectively. Unemployment among textile mill workers averaged 5.1 percent during the 3 months ending in October, a slight increase over the 4.7 percent rate in the 3 months ending in July.

## U.S. COTTON SITUATION AND OUTLOOK

## Upland Cotton Situation

## Larger Acreage Offsets Lower Yields

Based on November 1 conditions, 1988 upland cotton production is forecast at 14.5 million bales, about matching the 1987 crop and less than 1 percent below the August es-

timate. Based on past differences between the November estimate and final production, there is a 67-percent chance that 1988 production will range between 14.0 and 15.0 million bales.

Larger acreage is offsetting lower yields, leaving the crop virtually unchanged from last year. Total upland area for harvest is estimated at 11.5 million acres, up 16 percent from last year and reflecting the lower acreage reduction program for the 1988 crop. Upland yields are expected to average 606 pounds per harvested acre, 96 pounds below the 1987 national average (Table A).

Upland cotton production in the Southwest is expected to total 4.8 million bales, down almost 200,000 from last season. Despite an increase in harvested acreage of almost 700,000 acres, significantly lower yields have resulted in lower production. Increased production in other regions of the Cotton Belt has offset these losses.

The Delta States expect to produce 4.7 million bales, 2 percent above last year and up 4 percent from the August forecast. Production in the Western States is projected at 4.0 million bales, 1 percent above last season and almost unchanged from the August estimate. The Southeastern States are expected to harvest 1.0 million bales, up 5 percent from last year but 4 percent below the August estimate.

## Mill Use Expected Down Slightly

Last season, U.S. mills used more upland cotton than at any time since 1972/73. Strong early-season usage, partially related to strong denim business, led to the increase (figure 1). Upland mill use for $1987 / 88$ totaled 7.6 million bales. This season, larger textile inventories, slower demand for denim, and consumers' preference for more fine count yarns

Figure 1
Upland Mill Use and Cotton's Share Both Rebound

1/ Cotton's share of total tibers used on the cotton system.
2/ Seasonally adjusted annual rate.
and products could contribute to mill consumption declining to 6.9 million bales.

Consumption on a seasonally adjusted annual rate for August, September, and October averaged nearly 7.1 million bales. Similarly, cotton's share of fibers used on the cotton system represented about two-thirds of the total, an increase of 2 percent over July. Lower cotton prices relative to polyester may also result in some substitution of cotton in blends later this marketing year (figure 2).

Although cotton textile imports remain at very high levels, foreign shipments have declined. During the first 9 months of 1988, U.S. imports of foreign cotton textiles totaled 3.3 million bale-equivalents, 9 percent below the same period in 1987. In addition, U.S. cotton textile exports increased almost 9 percent above year-ago levels. Even

Figure 2
Cotton Prices Fall Relative to Manmade Fibers

* Raw fiber equivaient.
though the weaker dollar has led to a slight improvement in the cotton textile trade balance, the deficit is expected to be near 3.8 million bale-equivalents for calendar 1988 , or about one-third of total domestic consumption this year.

## Cotton Exports Remain Slow

Upland cotton export sales at the start of 1988/89 totaled only 2.2 million bales, 1.3 million below last season and the lowest in 3 years. Outstanding sales plus shipments through mid-November totaled 3.3 million bales, compared to 5.1 million last season. Fierce overseas price competition has been largely responsible. Exports during 1988/89 are expected to fall to 4.7 million bales, 26 percent below last season.

Although the Secretary of Agriculture made several changes in the upland cotton program last August to make U.S. cotton more competitive in world markets, U.S. price quotations still remain above competitors'. U.S. prices for 1988crop cotton delivered on the Northern European market climbed 5-7 cents per pound above foreign prices last summer. In October, Memphis Territory-A type cotton averaged 62 cents per pound c.i.f. Northern Europe, while price quotations from Pakistan, which are generally the lowest in the index, were 57 cents (figure 3). Similarly, for coarse count cottons, Orleans/Texas price quotations ranged 5-7 cents per pound above Pakistani quotes last spring and early summer. However, during October the price difference narrowed to 2.5 cents per pound (figure 4). For the first 3 weeks in November, Orleans/Texas prices averaged 55.8 cents per pound, compared to 51.8 cents for Pakistani growths.

## Marketing Loan in Effect

World and U.S. upland cotton prices generally moved lower last season, reflecting larger U.S. and foreign produc-

tion, stable world consumption, and adequate carryover supplies. The adjusted world price (U.S. equivalent of world prices) dropped below the loan rate during July, and has remained below the loan level during the first 4 months of the 1988/89 marketing year.

The adjusted world price (AWP) continued to fall through the end of August. Since then, the AWP has increased to nearly 45 cents per pound, up 3 cents from the early season low. The U.S. average spot price and December futures have followed a similar pattern. However, the spread between December futures prices and the AWP has increased from nearly 5 cents per pound in early August to around 11 cents in late November (table B). Changes in the upland cotton program made in late August changed these relationships. The basis between the average spot price and the AWP ranged between 7 and 9 cents during the first 4 monihs of the marketing year.

## Carryover Stocks Expected To Rise

U.S. upland cotton stocks were expected to decline last year. However, record yields and lower-than-expected cotton use resulted in stocks increasing 700,000 bales to 5.7 million. Reduced export demand and lower domestic mill use will likely result in carryover stocks near 8.7 million bales this season, over twice the level specified in the Food Security Act of 1985.

Reduced export demand and lower cotton prices this season have resulted in substantial CCC loan entries. On October 31, almost 1.6 million bales of 1988 -crop cotton had been placed under loan (table C). In addition, over 2 million bales of 1986 and 1987 -crop cotton remain under loan, with Southern Plains cotton accounting for the majority.

1/ Spot and Dec. futures prices are for SLM $1-1 / 16$ inch cotton, the U.S. base quality. 2/ Adjusted world price is the Northern Europe price adjusted to SLM 1-1/16 inch at average U.S. producing location. Adjusted world prices are applicable for the week following the date shown.

## Outlook for 1989/90

## High Stock Levels Dominate Outlook

The 1989/90 upland coton marketing year is expected to begin with almost 200 days of carryin stocks, compared to a 100 -day supply at the start of $1988 / 89$. Beginning inventory next season is expected to reach 8.7 million bales, more than double the desired level. Lower domestic mill use and export potential during 1988/89 is expected to increase stocks by 3 million bales.

## Program Provisions Should Reduce Stocks

The Secretary of Agriculture has announced major provisions of the 1989 upland cotton program. The new
program will not be significantly different from the current one. However, producers will be required to reduce their cotton acreage by 25 percent of their base ( 12.5 percent was required in 1988) to be eligible for target price protection and the CCC loan program. A paid land diversion program will not be implemented.

Specifics for the 1989 -crop program include a target price of 73.4 cents per pound, with a loan level of 50.0 cents for base quality upland cotton - Strict Low Middling (SLM) 1$1 / 16$ inch, micronaire 3.5 to 4.9 , at average U.S. location. In addition, if the adjusted world price (AWP) for cotton falls below the announced loan rate, the Plan B marketing loan program will be put into effect. Under Plan B, 1989-crop cotton pledged as collateral for a price support loan may be repaid at the lower of the AWP or the loan level.

The AWP is determined for base-quality cotton. For other qualities and locations, it will be further adjusted by applying the 1989 -crop price support schedules of premiums and discounts for grade and staple, discounts for micronaire, location differentials, and any coarse count adjustment in effect for the week in which the loan repayment occurs. Regardless of the quality, the AWP will not be established at less than 5 cents per pound.

Loan deficiency payments will be made to eligible producers who agree to forego loan eligibility if the loan repayment rate is less than the announced loan level. The payment rate will equal the difference between the loan level and the loan repayment rate. Producers may elect to forego loan eligibility on a bale-by-bale basis.

Loan redemption procedures implemented last August for 1988 -crop cotton will also apply next season. When loan collateral is redeemed with cash and the AWP is below the loan rate ( 50.0 cents per pound) for base quality, the CCC will not require payment of any interest and will pay all the warehouse charges. When the AWP is above the base loan rate, CCC will not require the payment of that portion of the accrued interest, and will pay any accrued warehouse charges that are deemed necessary to permit the loan collateral to be redeemed with cash at the AWP.

If certificates are used to redeem upland cotton that has been placed as collateral under CCC loan, the cotton will be redeemed at the AWP for the week in which the certificates are presented for redemption. Accrued warehouse charges are not paid by CCC unless the loan is phased into an extended status. When cotton under loan is obtained with certificates, storage charges for the first 10 months the cotton was under loan are paid by the CCC, but storage charges will accrue for months 11 through 18 of the loan.

In addition to the other provisions, it was also announced that a recourse loan program for upland seed cotton would be continued and that the inventory reduction program would not be used. The signup period for the program will begin December 19, 1988, and end April 4, 1989. During signup, producers may request 30 percent of their estimated deficiency payments.

Enrollment in the 1989 upland coton program will likely exceed this year's 88 -percent participation, because of deteriorating market conditions for upland cotton. If participation increases to 1986 or 1987 levels ( 93 or 92 percent, respectively) planted acreage could decrease to between 9 and 11 million acres, with less than 1 million planted outside the program. Depending on yields, the 1989 crop could range from 10 to 14 million bales. With trend yields, the upland crop could approach 12 million bales, almost 2.6 million below the projected 1988 crop.

## Demand Prospects May Improve

Competitive cotton prices relative to manmade fibers, continued strong consumer demand for cotton products, and strengthening textile activity next season should lead to increased cotton consumption by U.S. mills. Mill use will again be limited by competition from textile imports, but should still top 7 million bales in 1989/90.

Despite the changes made last August in the upland cotton program in order to make U.S. growths fully competitive in world markets, U.S. cotton exports during 1988/89 will likely fall significantly from the previous year. Fierce price competition from foreign competitors has limited the potential for U.S. exports this season. However, prospects for 1989/90 should improve. Increased world import demand and lower foreign exportable supplies should lead to larger U.S. cotton shipments next season. Upland cotton exports could range between 5.5 and 6.5 million bales during the 1989/90 marketing year. Expected disappearance could exceed expected production by more than 1 million bales. However, ending stocks are expected to remain well above the 4 -million-bale level. Unless crop problems arise, either in the United States or overseas, and if no additional program changes are implemented, it will likely take several years to reduce carryover supplies to the desired level.

## ELS Cotton Situation

## Record Production Expected

Based on November conditions, U.S. yield per harvested acre for extra-long staple (ELS) cotton is estimated at 943 pounds, little changed from the August estimate. However, ELS production for 1988 is estimated at 367,200 bales, down 5 percent from the August estimate because of a similar reduction in harvested average (table D). In addition, estimated exports of ELS cotton of 300,000 bales are down 5 percent. The revisions notwithstanding, both production and exports should be at record levels in 1988.

Domestic mill consumption for the first 2 months of 1988 indicates stronger demand than in 1987. Actual mill consumption of ELS cotton in August and September 1988 (1987 in parentheses) was $7,737(4,565)$ and $9,113(6,073)$ bales, respectively. These levels represent a seasonally adjusted annual usage rate of about 100,000 bales. Mill use in early 1988 is being bolstered by increased demand for stronger, finer count yarns for which ELS is well suited. Despite this early-year strength, 1988/89 ELS mill use is estimated at 50,000 bales, based upon anticipated weaker mill usage and high prices. Based upon estimates of production, exports, and domestic consumption, stocks at the end of 1988/89 are projected at 60,000 bales.

Table D.-Estimated 1988 and actual 1987 ELS cotton acreage,

## Foreign Exportable Supply Increases

Based upon International Cotton Advisory Committee estimates, 1988 foreign production of ELS cotton is placed at 5.4 million bales, up about 14 percent from the previous year. Consumption is estimated at 4.1 million bales in 1988 , up about 8 percent from 1987. With consumption lagging increases in production, exportable supplies among foreign producers should increase in 1988/89 despite lower beginning stocks, 369,000 bales, than in the previous year ( 682,000 bales). The larger exportable stocks will likely pressure U.S. exports this season. Projections of lower exports among foreign producers in 1988/89 may result in yearending stocks increasing to 456,000 bales (table E).

## WORLD COTTON SITUATION AND OUTLOOK

## Foreign Supplies Continue Tight in 1988/89

Both world and foreign cotton stocks at the beginning of 1988/89 are the lowest since 1984/85. Rising stocks in the United States will push world 1988/89 ending stocks up nearly 1 million bales (table F ).

Foreign stocks are projected to drop more than 2 million bales as foreign use rises. Most of the gain will be in exports; consumption is expected to be only marginally higher. Foreign output is projected up this season, but gains in production are expected only to offset the lower beginning stocks, not the higher use, so foreign supplies will begin next season lower still (figure 5).

Figure 5

1/ Based on Nov. 9, 1988, World Agricultural Supply and Demand Estimates report. 1987/88 estimated and 1988/89 projected. Totals may not add and stocks may not balance due to rounding, a small quantity of cotton destroyed, and differences unaccounted. 2/ Eastern Europe, Western Europe, Japan, Hong Kong, Republic of Korea, and Taiwan. 3/ Australia, China, Central America, Egypt, Mexico, Pakistan, Sudan, Turkey, and the USSR. 4/ Less than 50,000 bales.

## Smaller Growth in Foreign Production Expected

Foreign production is expected to rise 5 percent in 1988/89 to 69.1 million bales. Output looks particularly good in India, the Soviet Union, and the Mediterranean countries. But production gains were recently reduced somewhat because of weather problems in China, South Asia, and the Southern Hemisphere.

Cloudy weather delayed the cotton harvest so long in two important Chinese provinces that plants had to be removed so the winter wheat crop could be planted, cutting China's prospective output from 21 to 19.5 million bales. Heavy rain and some flooding in Pakistan and India also hurt cotton; but Pakistan's output is still expected to be the second highest ever, and India could still produce a record crop.

In the Southern Hemisphere, Brazil, Argentina, and to a lesser extent Paraguay, experienced such dry weather that planting was delayed, reducing area from earlier forecasts. Australia is also cutting area in response to relatively low world prices.

## Consumption and Trade Stagnate in 1988/89

Foreign consumption is estimated up marginally in 1988/89 because continued strong use among major producers is just sufficient to offset reductions among importers. Consumption is forecast at 75.8 million bales, compared with 75.6 million last year.

Like the United States, major foreign importers are cutting use this season. In part, this is because of smaller denim demand in the United States, a major market. Another contributing factor has been stronger consumer preference for rayon, particularly in the other major market, Western Europe.

World exports should slip slightly as cotton importers reduce use. All of the loss will occur in U.S. exports. Competitive prices are expected to push foreign cotton exports up 9 percent, nearly 1.5 million bales. The foreign share of the world market is forecast to rise from 72 percent in 1987/88 to 79 percent in 1988/89. Pakistan, the Soviet Union, Argentina, Paraguay, some of Africa, and producers around the Mediterranean will gain at the expense of the United States, whose share is expected to fall from 28 to 21 percent. Excluding 1985/86, when U.S. exports plummeted, this is the lowest U.S. market share in years.

## U.S. Exports May Recover in 1989/90 Because of Tight Foreign Supplies

Relatively low cotton prices, if they continue, should dampen gains in 1989/90 Northern Hemisphere production. The A Index and all futures quotations are now in the $50-60$ cents per pound range, at least 10 cents below the same time last year.

Foreign production is likely to rise in 1989/90, despite the lack of world price incentives. Because of tight supplies at the end of 1988/89, important producers such as the Soviet Union, India, and China, which account for nearly 60 percent of foreign production, may promote yield expansion again next year.

Rapidly rising polyester and rayon prices should also encourage world cotton consumption next season, even if total fiber consumption continues to stagnate. In recent months, a shortage of ethylene glycol, a component in polyester production, has pushed polyester prices up sharply worldwide (figure 6). If this shortage continues into 1989/90, more cotton use is expected.

Flovero 6
Foreign Polyester Prices Up Sharply

Exports should rise in 1989/90 as consumption improves. Tight supplies, particularly in the Soviet Union and China, may limit potential foreign export growth. U.S. exports and export market share could rebound somewhat as a result.

## U.S. WOOL SITUATION AND OUTLOOK

Raw wool mill consumption in the third quarter of 1988 was 34.5 million pounds, clean, almost 7 percent below the second quarter but more than 2 percent above a year earlier (table G). Apparel mills used 30.1 million pounds. The woolen system consumed 12.2 million pounds, 15 percent below the previous quarter and 5.5 percent less than a year earlier. It was the smallest woolen system quarterly mill activity since fourth-quarter 1982. Rising wool prices caused larger-than-usual fabric orders to be placed in late 1987 and early 1988 . Third-quarter reorders were smaller than usual.

The worsted system used 17.9 million pounds in the third quarter, 5.5 percent less than the previous quarter but 4.3 percent above last year. The worsted system used the largest share of coarser-than- 60 's, 29 percent, since fourth-quarter 1986. This share had risen from 26 percent in the second quarter and 21 percent in the first. Carpet mills took 4.5 million pounds in the third quarter, 15 percent more than the second quarter and 19 percent above a year earlier. Total raw wool mill use in 1988 is estimated at 145 million pounds, 2 percent above last year (table H ).
U.S. imports of raw wool in the third quarter were 16.1 million pounds, clean, down 36 percent from the second quarter and 32 percent below a year ago (table I). This relatively large decline is almost entirely due to American mills' smaller use of the finer (and more expensive) grades. Dutiable wool imports in the third quarter were 9.9 million

pounds, 52 percent below the second quarter and 29 percent less than last year. Imports of finer-than-58's in the third quarter, at 8.7 million pounds, were the smallest for any quarter in more than 3 years. September imports, 1.1 million pounds, were the smallest monthly quantity since October 1979. About 94 percent of the third-quarter dutiable imports
came from two countries: Australia, 87 percent, and New Zealand, 7 percent.

Duty-free imports were 6.1 million pounds, almost 3 percent more than the second quarter, but 37 percent below a year ago. About 94 percent came from 2 countries: New Zealand, 80 percent, and the United Kingdom, 14 percent.

The share of raw wool imports entering the United States through the New England and the Middle Atlantic customs districts has declined every year, from 45 percent in 1985 to 27 percent during the first 9 months of 1988 (table J). Conversely, the percentage entering through the South Atlantic and other districts has risen from 55 percent to 73 percent. During January-September about 64 percent of the duty-free wool came through the New England and Middle Atlantic regions, compared with 15 percent of the dutiable. In contrast, most of the dutiable raw wool, 85 percent, entered through the South Atlantic and other customs districts along with 36 percent of the duty-free.
U.S. prices of territory raw wool behaved in a mixed pattern by the middle of the fourth quarter. The 64's increased more than 5 percent from August to $\$ 4.75$, clean basis, in November, while 62 's increased 2 percent to $\$ 3.63$. The 58 's were unchanged at $\$ 2.45$, while the 56 's were up 3 percent to $\$ 2.20$. The simple average price received by farmers

The Department of Agriculture has announced proposed price support levels for shorn wool, pulled wool, and mohair for the 1989 marketing year. The shorn wool support price is determined based upon a formula prescribed in the Wool Act. Based on current reported indexes, the 1989 shom wool support price will be $\$ 1.77$ per pound (grease basis). The support price for pulled wool, as designated in the Wool Act, shall be set at a level relative to the support price for
shorn wool to maintain normal marketing practices for pulled wool.

The law also provides that mohair must be supported at a level, determined by the Secretary of Agriculture, that is necessary to maintain approximately the same percentage of parity as for shorn wool. The deviation of mohair support prices shall not cause an increase or decrease of more than 15 percent from the comparable percentage of parity at which shom wool is supported. Based on current reported indexes, the 1989 mohair support price would be $\$ 5.40$ per pound, grease basis, at 100 percent of the comparable percentage at which shom wool is supported. The minimum support price would be $\$ 4.59$, while the maximum would be \$6.21.

## WORLD WOOL SITUATION AND OUTLOOK

The 1988/89 world supply of raw wool is estimated at 4.22 billion pounds, clean, 0.7 percent more than last season. Although 1988/89 world production, 4.06 billion pounds, is 2.1 percent above the previous season, stock depletion has reduced the carryin to the lowest in 15 years. Exports of raw wool from the five main exporting countries are expected to be the same as last season, about 1.8 billion pounds, clean. The latest data (for the 1986/87 season) indicate the shares of the five leaders: Australia - 58 percent, New Zealand - 30 percent, Argentina - 5 percent, Uruguay - 4 percent, and South Africa - 3 percent.

Second-quarter 1988 consumption of raw wool in 11 major wool textile manufacturing countries was 384 million pounds, clean, a 0.3 -percent decline from the first quarter, but 0.4 percent above a year earlier. Second-quarter production of yams on the worsted system in 10 major producing countries was 482 million pounds, clean, 0.3 percent less than the previous quarter. Yarn production on the woolen system in 8 countries was 298 million pounds, clean, 0.1 percent more than the first quarter. Production of woven wool fabrics in 10 major producing countries, 454 million square
yards in the second quarter, was 7.4 percent greater than the first.

With more than one-third of the season gone, Australian wool prices declined about 9 percent from the season's opening to early September, when the market indicator (MI, a weighted average index of 13 wool categories) reached 987A cents per kilogram, clean. The market then strengthened, rising 11 percent by mid-October to 1100 . During the following month the demand weakened with the MI declining to 977 . The major buyers have been Japanese mills, with strong support from Eastern and Western European mills. In mid-November, the Australian Wool Corporation stockpile reached 32,914 bales. Although this was more than 4 times the level at the season's start, it was less than 10 percent of the June 1987 level and less than 4 percent of the June 1986 level.

Nine countries were the destination of almost 80 percent of Australia's 1987/88 raw wool exports: Japan - 20 percent, China - 11 percent, the USSR and Italy - 10 percent each, France - 7 percent, Korea - 6 percent, West Germany, Taiwan, and the United States - 5 percent each.

During August-September, the New Zealand wool market experienced strong demand. The New Zealand market indicator rose from 620 NZ cents per kilogram, clean, to a record 741 in early October. Since then, the market eased, with the MI dropping to 669 by mid-November. The leading customers have been China and the USSR. In late October, New Zealand Wool Board stocks were 55,500 bales, 59 percent of the July 1 level.

Wool production in New Zealand during the 1988/89 season is forecast to be 551 million pounds, clean, 4 percent below the $1987 / 88$ output. A lower yield will offset an increase of 1.2 percent in sheep numbers to 65 million. Eight countries were the destination of more than two-thirds of New Zealand's 1987/88 raw wool exports: China - 20 percent, the United Kingdom - 10 percent, the USSR and Japan 9 percent each, Belgium -6 percent, West Germany and the United States - 5 percent each, and the Netherlands - 4 percent.

The South African market opened August 31 on a generally steady note, with the market indicator at 2,053 SA cents per kilogram, clean. The MI climbed during August-September, averaging 2,138 with 98 percent of the offering sold. During October, the market indicator reached a record 2,363, surpassing the previous peak last April 22 of 2,250 . The October average was 2,297 , with 96.6 percent of the offering sold. The market softened in late October, and continued soft until mid-November when the MI rose to 2,103. Stocks of the South African Wool Board more than doubled from the 4,341 bales on hand September 2, to 8,766 bales on November 4.

## MOHAIR

U.S. mohair exports during the third quarter were 2.9 million pounds, clean, 27 percent less than the second quarter and 11 percent below the comparable period last year. About 96 percent of the third-quarter shipments went to three countries: the United Kingdom-76 percent, India-15 percent, and Taiwan-5 percent. Exports in 1988 are expected to total 13 million pounds, 7 percent below last year (table L).

Current U.S. mohair prices are higher than last summer, reflecting strong overseas demand. Adult hair is $\$ 1.90$ per pound, compared with $\$ 1.30$ last August. Young goat is $\$ 3.00$, and was $\$ 2.25$ in August. Kid, at $\$ 5.75$, has not changed. These prices should continue through 1988. The fall clip was about 5.7 million pounds, clean. Large overseas shipments have brought stocks down to 1 million pounds, one-third of last year's level. Heavy culling of herds continues because sheep and cattle offer better profit in the short run than angora goats. Mexico is a major market for surplus goats.

Strong demand this fall has come from Japan, Italy, the USSR, and China. This vigorous market is expected to continue through 1989. The principal end uses are scarves, sweaters, coats, and hand-knitting yarns. South African stocks, currently about 8 million pounds, are about half last year's. Production this year, 2.5 million pounds, is about the same.

## MANMADE FIBERS

Production of nonglass manmade fibers in the third quarter was 2.25 billion pounds, down 3.3 percent from the second quarter and 2 percent more than last year. End-ofSeptember stocks at producers' plants were 1.5 percent less than in June, but up 6 percent from a year ago. Staple stocks were down 4 percent from June, mostly in nylon staple (30
percent). Filament stocks were up 1 percent overall. The major exception was nylon carpet filament, down 19 percent. Mill consumption in the third quarter, 2.27 billion pounds, was 2 percent below the previous quarter and the same as a year ago.

Domestic shipments of noncellulosic fibers in the third quarter, 1.95 billion pounds, were 1.6 percent less than in the second. Staple fiber shipments, 0.98 billion pounds, were down 1 percent, while filament fibers, 0.97 billion, were 2.3 percent below the previous quarter.

Consumption data for the second quarter are shown for the three major fiber markets in table 12. The carpet market continues to be the largest ( 34 percent), consuming 729 million pounds. Carpet use of fibers has continued high despite soft construction activity. Second-quarter use was 1 percent above the first and 3.6 percent more than the 1987 average. The strength of the carpet market has resulted largely from replacement sales. Many homeowners have been influenced by the recently developed and promoted "stain resistant" carpet properties. Nylon, at 61 percent, is the major carpet fiber. Olefin is in second place with 30 percent. Estimates for the third quarter indicate that 467 million pounds of nylon were shipped to carpet mills, 4 percent above the first two quarters.

Woven textiles continue as the second largest ( 27 percent) manmade fiber market. About 570 million pounds were used in the second quarter, 1 percent above the first and 4 percent more than the 1986/87 quarterly average. Polyester, at 58 percent, and olefin fibers, at 16 percent, together constitute almost three-fourths of this market.

The knit market used about 343 million pounds in the second quarter, more than 4 percent above the first quarter. Polyester's share, 184 million pounds, was 54 percent, while nylon at 65 million pounds was 19 percent. Acrylic fibers, at 86 million pounds, were 25 percent.

Prices of raw materials used to make noncellulosic fibers continued to rise in the third and fourth quarters (table M). Pressure comes from domestic sales and overseas shipments aided by a weak dollar.

Para-xylene (a raw material for polyester fiber) has increased 1-2 cents per pound since last summer to the 25-27 cent range. Xylene prices are influenced not only by the demand for polyester fiber and film but also by the demand for gasoline. A precursor is used as an octane enhancer. The price of ethylene glycol (a raw material for polyester fiber) continued to rise during the third quarter and into the fourth. It has increased by half in the last 6 months because of the strong fiber and nonfiber demand for ethylene-derived chemicals. Cyclohexane (a raw material for nylon) has had a relatively steady price. The October increase of 6-7 percent reflects a higher benzene price, a precursor, and the strong demand for nylon.

The acrylonitrile price, $\$ 0.36$ per pound, has not changed because of weak fiber and nonfiber acrylonitrile end-uses. Caprolactam's (a raw material for nylon) price, \$0.87-0.90, has not changed since early summer. Propylene, a precursor for acrylonitrile and olefin fibers, has had a rather stable price, about 17 cents. Inventories are about 50 percent above last year because production has been greater than consumption.

# REAL TRADE-WEIGHTED EXCHANGE RATES FOR THE RAW-FIBER EQUIVALENT OF U.S. IMPORTS OF COTTON AND MANMADE FIBER PRODUCTS 

Scott Sanford and Bob Skinner<br>Agricultural Economists, ERS, USDA

#### Abstract

This is the first of two articles investigating the relationship between U.S. textile product imports and the value of the dollar. Trade shares of importing countries are determined, and used to compute trade-weighted exchange rate indexes. These indexes are presented, compared, and analyzed for theoretical consistency with observed trade patterns. The second article will employ econometric techniques to assess statistically the relationship between imports and the value of the dollar, and will be presented in a subsequent issue of this publication.

Keywords: textile product imports, trade-weighted exchange rates

## Introduction

During the 1980's, the value of the dollar versus major foreign currencies has undergone substantial change. Emerging from a low in 1979, the dollar gained strength through the early 1980's, peaked in 1985, and has generally declined since.

The theoretical impact on U.S. trade of a strengthening dollar has been stated this way: A stronger dollar makes U.S. exports more expensive to other countries, thereby reducing demand. A strong dollar also causes the price of imports into the United States to decline in dollar terms,
creating competitive pressures on domestic producers that compete with imports, such as the automobile, steel, and textile industries (Schuh et al).

A weakening dollar would be expected to yield converse results. General U.S. trade patterns have tended to support these observations and, with respect to the farm sector, analysts have concluded that the real value of the dollar contributed to a reduced volume of U.S. farm exports in the early 1980's (Batten and Belongia).

As interest in exchange rates has increased, refined techniques of calculating comparative currency values have been
developed. When discussing a particular commodity it is common practice to calculate an exchange rate for the individual commodity, rather than rely upon a general measure of the value of the dollar. This takes into account the diverse countries that may trade for a particular commodity. Also, focusing on a particular commodity avoids aggregation of items that may involve substantially different value.

Once a particular commodity is identified, along with those countries with which the United States trades the item, the procedure may be further refined by adjusting for different levels of trade by individual countries. The final adjustment involves taking into account differing rates of domestic inflation among trading partners. The result is a commodity-specific real trade-weighted exchange value of the dollar.

## Data and Methodology

The volume of U.S. imports of textiles and apparel is closely monitored and reported by both government and industry, for purposes ranging from monitoring bilateral trade agreements to assessing potential impacts of imports on the domestic textile industry. These data are reported in several forms, including end-use (such as mens' and boys' shirts) and quantity of material (such as cotton, wool, and manmade fiber). When reported by quantity of fiber, common units of measurement are square yards equivalent and pounds of rawfiber equivalent. USDA's Economic Research Service monitors monthly textile trade data and reports import volume in pounds of raw fiber by fiber type and country of origin. These data are used in this analysis.

The preliminary procedures, involving identification of countries exporting textiles to the United States and determination of the volume of monthly exports, are readily accomplished using selected issues of the Cotton and Wool

Situation and Outlook Report (CWS). For instance, 1987 raw cotton equivalents of U.S. monthly imports by country are reported in tables 26 and 18 of CWS-52. Similar tables report manmade fiber imports.

As may be noted, the number of countries exporting to the United States is large-frequently in excess of 100 for a specific fiber. An analysis of the type undertaken here would be quite onerous if every country were strictly accounted. Fortunately, the presence of several very large (by volume) and consistent (across time) importers permits a narrowing of data without seriously diluting the coverage. Major exporters and their respective trade shares by fiber type are presented in Table 1.

A real trade-weighted exchange rate index allows an examination of the value of the dollar versus the currencies of major trading partners across time. The value of the index at a specific time, $t$, is computed as:

Eq.(1) $100 * \exp \sum_{i=1}^{n} w_{i} \log _{e} R_{i t}$
where exp denotes the exponential operator,
$w_{i}$ represents the trade share of country $i$, and
$\mathrm{R}_{\mathrm{it}}$ represents the real exchange rate for country i expressed in natural logarithms, as a ratio to the base period, $\mathrm{R}_{\mathrm{ib}}$.

Thus, the trade shares in Table 1, calculated according to the weighted average share of 1985-87 imports for the respective countries, are important components of the index and enter directly into the calculation of the index as $\mathrm{w}_{\mathrm{i}}$ in the equation. The $w_{i}$ must sum to unity in each column of Table 1. It may be noted from Table 1 that shares are

| Fiber type |  |  |  |  |  |  |  |  |

|  |  |  |  |  |  |  |  |  |

presented in two ways-first including China and then excluding China. The rationale for the special treatment of China is presented below.

In Eq.(1), the exchange rate, $R$, is expressed in real terms, indicating that adjustments have been made to account for inflation's impact on currency values. In order to do this, data on nominal exchange rates and consumer prices for each country are necessary. The International Monetary Fund (IMF) reports these data for its members and is the major source of data used here. However, not all countries belong to the IMF, and for some of those which belong, data are incomplete or reported with considerable lags (International Financial Statistics). China is one country for which data are reported with considerable lag.

In addition, since China is a centrally planned economy, there is some question concerning the relevance of consumer price data. Analysts have argued that prices in centrally planned countries do not by themselves equate supply and demand, but rather consumer lines either lengthen or shorten according to the availability of goods (Stallings). In the absence of more concrete evidence concerning the appropriate treatment of China, the authors present results both including and excluding this country.

## Results and Implications

Since first-quarter 1985 the exchange value of the dollar as measured by the Federal Reserve Index has declined sharply. As a result, many observers of the U.S. trade

Table 2.--Real trade-weighted exchange rate indexes, 1980=100

Table 3.--Monthly change in U.S. textile imports from like month of preceding year

balance have anxiously awaited a similar drop in U.S. imports of foreign goods. For some groups of imported goods, notably textile products, the anticipated falloff has been slight and slow in materializing. Not surprisingly, some studies have concluded that there is little, if any, relation between exchange rates and U.S. textile product imports (Schwartz; Economic Consulting Services Incorporated). In a study similar to that undertaken here, a significant relation has been observed (Chmura). Critical to detection of this relationship is a focus on real, rather than nominal, exchange rates.

Table 2 reveals that, when compared to a general U.S. trade index, the indexes for textile products neither increased as much from 1980 to 1985 as did the general index, nor decreased as sharply thereafter ( $1980=100$ for all indexes). Thus, one would not expect textile trade patterns to necessarily follow general trade patterns.

Additionally, the indexes for specific fibers in Table 2 show quite different trends. Somc indexes peak at about the same time as the general trade index, while others peak much later. The overall relative stability of the indexes also suggests that textile importers have been less pressured to increase prices to protect profit margins. Consequently, they have maintained their competitiveness with domestic textile producers.

The data presented in Table 3, based upon original data not seasonally adjusted, indicate that volume of textile imports has begun to decrease since the end of 1987. Given the sharp drop in the indexes since first-quarter 1987 and allow-
ing for an appropriate adjustment period for imports, this pattern appears consistent with the trend of the indexes. In the second portion of this study, individual indexes will be assessed for statistically significant relationships with observed U.S. import trade patterns.

#### Abstract

Textile exports in 1987, at 914 million pounds, increased 13 percent from 1986. The division by fiber type was similar in both years: cotton 33-34 percent, wool 2 percent, and manmade $64-65$ percent. By destinations, 1987 exports increased $16-18$ percent to the Western Hemisphere, Asia-Oceania, and Africa. Shipments to Western and Eastern Europe showed no change.

Keywords: Textile exports, cotton, wool, manmade fibers

## Total Textile Exports, 1986 and 1987

United States textile exports in 1987 totaled 914 million pounds, raw fiber equivalent basis, an increase of 13 percent from 1986 (table 1). Manmade fiber textiles were almost two-thirds ( 65 percent) of 1987 total exports, and were 14 percent higher than in 1986. Cotton textiles made up about one-third, and increased 9 percent from 1986. Wool textile exports were about 2 percent and experienced a 46 -percent increase from the previous year.

Practically all of the U.S. textile exports in both 1987 and 1986 went to three regions: Western Hemisphere, 55 and 54
percent, respectively; Asia-Oceania, 23 and 22 percent; Western Europe, 19 and 22 percent (table 2). Negligible quantities went to Eastern Europe and to Africa.

Most U.S. textile exports were in four product categories: fabric ( 35 percent in 1987 and 44 percent in 1986), apparel (21 and 19 percent, respectively), floor covering ( 11 and 10 percent, respectively), and yarn ( 8 and 10 percent, respectively).

Ten countries received more than 63 percent of total 1987 textile exports: Canada ( 19 percent), Mexico ( 12 percent),

[^0]the Dominican Republic ( 6 percent), 5 percent each to Saudi Arabia, the United Kingdom, and Italy, Japan (4 percent), China ( 3 percent), and Costa Rica and Belgium ( 2 percent each). The ten biggest recipients in 1986 were almost the same: Canada ( 19 percent), Mexico ( 11 percent), Italy ( 7 percent), 6 percent each to the Dominican Republic and the United Kingdom, Saudi Arabia ( 5 percent), China ( 4 percent), 3 percent each to Belgium-Luxembourg and West Germany, and Japan (2 percent).

## Cotton Textile Exports

In both 1987 and 1986 cotton textile exports, 298.2 and 274.6 million pounds, respectively; consisted essentially of three product categories: fabric ( 36 and 46 percent, respectively); apparel (36 and 27 percent, respectively); and household products ( 10 percent each year) (tables 3 and 4). Almost all cotton textile exports in both years went to the same three parts of the world: Western Hemisphere (55 and 48 percent, respectively); Western Europe ( 30 and 37 percent, respectively); and Asia-Oceania (13 and 12 percent, respectively).

Of the 164 million pounds of cotton textile exports shipped to the Western Hemisphere in 1987, apparel ( 54 percent) and fabric ( 20 percent) were the most important categories.

In 1986, 133 million pounds of cotton textiles went to the Western Hemisphere, and apparel (46 percent) and fabric ( 24 percent) were also the most important categories. About 89 million pounds went to Western Europe in 1987, of which 73 percent was fabric and 12 percent apparel. In 1986, fabric ( 85 percent) and apparel ( 8 percent) comprised a greater share of the 102 million pounds shipped to Western Europe. Asia and Oceania took 40 million pounds in 1987, of which 83 percent included fabric ( 25 percent), household products ( 23 percent), apparel ( 22 percent), and floor covering ( 13 percent). Shipments to Asia and Oceania in the previous year were 33 million pounds. Four product groups comprised 80 percent: fabric and household products ( 25 percent each) and apparel and floor covering ( 15 percent each).

## Wool Textile Exports

Wool textile exports in 1987, at 23.4 million pounds, were mostly in three product categories: tops, noils, and yarns ( 64 percent), apparel ( 18 percent), and fabric ( 10 percent) (table 5). Wool textile exports in 1986, 16.0 million pounds, had similar characteristics: tops, noils, and yarns ( 51 percent), apparel ( 24 percent), and fabric ( 14 percent) (table 6). In both years almost all the wool textile exports went to three regions: Asia-Oceania ( 52 percent in 1987 and 35 percent in 1986), Western Hemisphere ( 30 and 41 percent, respectively), and Western Europe ( 16 and 23 percent, respectively).

Of the 12.1 million pounds of wool textile products shipped to Asia-Oceania in 1987 and the 5.5 million pounds
in 1986, almost all ( 83 percent and 73 percent respectively) was tops, noils, and yarn. About 10 percent was apparel in both years.

Western Hemisphere countries took 7 million pounds in 1987 consisting of apparel ( 36 percent); yarn, tops, etc. ( 33 percent); and fabric ( 21 percent). In 1986 these countries took a slightly smaller amount, 6.5 million pounds, including apparel (43 percent); yarn, tops, etc., ( 25 percent); and fabric (22 percent).

Exports to Westem Europe were 3.8 million pounds in 1987 and 3.6 million in 1986. Yarn, tops, etc., was the major product category in both years - 63 percent in 1987 and 67 percent in 1986. In 1987 apparel was 13 percent and fabric 5 percent, while in 1986 they were 8 percent each.

Seven countries accounted for almost 65 percent of the wool textile exports in 1987 and almost 62 percent in 1986:

| Country | Chief product ${ }^{1987}$ group | Percent | Chief product ${ }^{1986}$ group | Percent |

## Manmade Fiber Textile Exports

Manmade fiber textile exports totaled 592 million pounds in 1987, of which 65 percent was in three product categories: fabric ( 36 percent), floor covering ( 15 percent), and apparel (14 percent) (table 7). In 1986, exports totaled 517 million pounds, of which 73 percent consisted of: fabric ( 45 percent), apparel ( 14 percent), and floor covering ( 14 percent) (table 8).

Almost all ( 97 percent) of the manmade fiber textile exports in both years went to three parts of the world: Western Hemisphere ( 56 percent in 1957 and 57 percent in 1986), Asia-Oceania ( 27 in both years), and Western Europe ( 14 and 13 percent, respectively). About 334 million pounds of manmade fiber textile exports went to Western Hemisphere countries in 1987, of which 62 percent was in 3 categories: fabric ( 31 percent), apparel ( 22 percent), and yarn ( 9 percent). The comparable Western Hemisphere shipments in 1986 were 294 million pounds, of which fabrics was 45 percent, apparel, 23 percent, and yarn, 9 percent.

Asia and Oceania took 159 million pounds in 1987; 37 percent was fabric and 36 percent was floor covering. In

1986 this area received 140 million pounds, of which fabric was 38 percent and floor covering 34 percent.

About 80 million pounds went to Western Europe in 1987. The chief product groups were: fabric ( 47 percent), yarn ( 14 percent), and floor covering ( 13 percent). In the previous year 69 million pounds went to Western Europe. The major groups were: fabric ( 54 percent), yarn ( 13 percent), and floor covering ( 9 percent).

The largest eight countries importing American manmade fiber textile products accounted for 62 percent of the total in 1987 and 61 percent in 1986:

## LIST OF APPENDIX TABLES

Table Page

1. Cotton acreage, production, and yield, by States ..... 25
2. U.S. cotton supply and use, by type, 1980/81-88/89 ..... 25
3. Cotton supply and use, all kinds, by months, 1985/86-88/89 ..... 26
4. Index of prices of selected cotton growths and price per pound of U.S. cotton, c.i.f. Northern Europe, 1983-88 ..... 27
5. C.i.f. Northern Europe price quotations for principle growth of "A" type cotton, weekly, August 1988 to date ..... 28
6. C.i.f. Northern Europe price quotations for principle growth of coarse count cotton, weekly, August 1988 to date ..... 28
7. Strict low middling spot prices in designated U.S. markets, loan rates, and prices received by farmers for upland cotton ..... 29
8. Fiber prices: Group B mill points, cotton prices, and manmade staple fiber prices at f.o.b. producing plants ..... 30
9. Upland cotton and manmade staple fibers: Mill consumption on cotton-system spinning spindles ..... 31
10. Cotton and manmade fibers: Daily rate of mill consumption, unadjusted and seasonally adjusted ..... 32
11. Cotton system spindles in place and active, and hours operated ..... 33
12. U.S. fiber consumption of cotton, wool, and manmade fibers, quarterly, 1984-1988 ..... 34
13. U.S. fiber consumption: Total and per capita, by type of fiber ..... 35
14. Manmade fiber production and capacity, quarterly, 1987-90 ..... 36
15. Domestic shipments of manmade fibers by major category ..... 37
16. Raw cotton equivalent of U.S. textile imports, monthly ..... 37
17. Raw cotton equivalent of U.S. textile exports, monthly ..... 38
18. Manmade fiber equivalent of U.S. textile imports, monthly ..... 38
19. Manmade fiber equivalent of U.S. textile exports, monthly ..... 39
20. Raw wool content of U.S. textile imports, monthly ..... 39
21. Raw wool content of U.S. textile exports, monthly ..... 40
22. Raw fiber equivalent of U.S. imports for consumption of vegetable fibers other than cotton textiles, monthly ..... 40
23. Raw fiber equivalent of U.S. imports for consumption of silk textile manufactures, monthly ..... 41
24. Raw cotton equivalent of U.S. textile exports by country, 1987 ..... 42
25. Raw cotton equivalent of U.S. textile exports by country, 1986 ..... 44
26. Manmade fiber equivalent of U.S. textile exports by country, 1987 ..... 46
27. Manmade fiber equivalent of U.S. textile exports by country, 1986 ..... 48
28. Raw wool equivalent of U.S. textile exports by country, 1987 ..... 50
29. Raw wool equivalent of U.S. textile exports by country, 1986 ..... 51

1/ Compiled from Bureau of the Census data and adjusted to 480-1b. net weight bales. $2 /$ August stocks adjusted to an August 1 basis, excluding preseason ginnings. 3/ Adjusted to 480-lb. bales by use of monthly conversion factors for mili stocks. 4/ Primarlly cotton on farms and in transit. Estimated by subtracting public storage and mill stocks from total stocks. 5/ August data include preseason ginnnings. 6/ Adjusted to a calendar month. $7 /$ Supply less disappearance. End-of-season stocks adjusted by Bureau of the Census data. Differences primarily reflect varying bale weights. Monthly data are rounded. 8/ Preliminary and estimated.

Table 4.--Index of prices of selected cotton growths and qualities, and price per pound U.S. cotton, c.i.f. Northern Europe, 1983-88 1/

1/ All prices are based on Thursday quotes. 2/ The "A" Index is an average of the cheapeast five types of M 1-3/32" staple length cotton offered on the European market. 3/ The Memphis and California/Arizona territories are based on Middling 1-3/32". 4/ The "B" Index is based on coarse grades of cotton varying in staple length from $1^{11}$ to $1-3 / 32^{\prime \prime}$. 5/ Based on SLM $1^{11}$ cotton.

Table 7.--Cotton: Strict low middling spot prices in designated U.S. markets,
loan rates, and prices received by farmers for upland cotton, 1983/84-1988/89'

1/ Spot market loan rates and prices are for cotton with micronaire readings of 3.5 through 4.9.
2/ Prices do not include an allowance for loans outstanding and government purchases. 3/ Weighted market average. U.S. prices based on U.S. monthly prices weighted by monthly marketings during the period August through the following July. 4/ SLM 1-1/16" average location. 5/ Mid-month price.
